

Ideation Phase

Date	27-06-2026
Team ID	23A51A05G8
Project Name	Software Installation Request Automation
Maximum Marks	2 Marks

Customer Problem Statement:

Employees often require licensed software to perform their daily work. In many organizations, software installation requests are handled manually through emails or verbal communication, resulting in delayed approvals, poor tracking, and inefficient coordination.

The proposed **Software Installation Request Automation** application built in ServiceNow automates the complete lifecycle through the Service Catalog. Employees submit requests, managers approve them, IT tasks are created automatically, license availability is validated, notifications are sent, and license counts are updated after successful installation. This improves efficiency, transparency, and compliance.
