

Project Design Phase

Problem – Solution Fit

Date	27-06-2026
Team ID	23A51A05G8
Project Name	Software Installation Request Automation
Maximum Marks	2 Marks

Solution Fit:

The **Software Installation Request Automation** application built on the ServiceNow platform provides an automated and centralized solution for managing licensed software installation requests within an organization. Employees can request software through a Service Catalog form by selecting the required software, entering business justification, urgency, device name, and additional notes. Once submitted, the system automatically creates a Software Request record and sends a request acknowledgement email. Using Flow Designer, the request is routed to the employee's manager for approval. If approved, an IT fulfillment task is created automatically for software installation. If rejected, the employee receives an immediate rejection notification. Business Rules validate software license availability before approval, automatically record the request date, decrement the available license count after successful installation, and update the fulfillment status. Automated email notifications keep employees informed throughout the entire lifecycle, including request received, approval, rejection, and installation completion. By automating the complete workflow, the solution reduces manual effort, improves license utilization, increases transparency, accelerates request processing, and delivers a better user experience for both employees and IT administrators.

SOLUTION FIT – SOFTWARE INSTALLATION REQUEST AUTOMATION

Automated end-to-end workflow for requesting, approving and installing licensed software
