

Project Design Phase

Solution Architecture

Date	27-06-2026
Team ID	23A51A05G8
Project Name	Software Installation Request Automation
Maximum Marks	4 Marks

Solution Architecture:

The **Software Installation Request Automation** solution is built on the ServiceNow platform using a layered architecture. Employees interact with the application through a Service Catalog item to request licensed software. The Business Logic Layer validates input, checks license availability, processes approvals using Flow Designer, and creates IT fulfillment tasks. • **User Interaction Layer:** Employees, Managers, and IT Fulfillers access the application through the Service Catalog and ServiceNow workspace. • **Business Logic Layer:** Catalog Client Scripts, UI Policies, Business Rules, Script Includes, GlideAjax, and Flow Designer automate request validation, manager approvals, notifications, and task creation. • **Data & Service Layer:** Custom Software Catalog and Software Request tables store application data, while Email Notifications, Dashboards, Reports, and Business Rules manage communication, tracking, and license updates. • **Integration Layer:** The architecture can be extended to integrate with Active Directory, Software Deployment tools, CMDB, Asset Management, and enterprise email services.
